## CHAPTER - 35 MAGNETIC FIELD DUE TO CURRENT

1. 
$$F = q\vec{\upsilon} \times \vec{B}$$
 or,  $B = \frac{F}{q\upsilon} = \frac{F}{IT\upsilon} = \frac{N}{A.sec./sec.} = \frac{N}{A-m}$ 

$$B = \frac{\mu_0 I}{2\pi r}$$

$$B = \frac{\mu_0 I}{2\pi r} \qquad \qquad \text{or, } \mu_0 = \frac{2\pi rB}{I} = \frac{m \times N}{A - m \times A} = \frac{N}{A^2}$$

2. i = 10 A, d = 1 m

$$B = \frac{\mu_0 i}{2\pi r} = \frac{10^{-7} \times 4\pi \times 10}{2\pi \times 1} = 20 \times 10^{-6} \text{ T} = 2 \text{ }\mu\text{T}$$

Along +ve Y direction.

3. d = 1.6 mm

So, r = 0.8 mm = 0.0008 m

$$\vec{B} = \frac{\mu_0 i}{2\pi r} = \frac{4\pi \times 10^{-7} \times 20}{2 \times \pi \times 8 \times 10^{-4}} = 5 \times 10^{-3} \text{ T} = 5 \text{ mT}$$

4. i = 100 A, d = 8

$$B = \frac{\mu_0 i}{2\pi r}$$

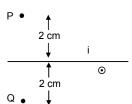

$$= \frac{4\pi \times 10^{-7} \times 100}{2 \times \pi \times 8} = 2.5 \ \mu T$$
5.  $\mu_0 = 4\pi \times 10^{-7} \ T\text{-m/A}$ 

$$r = 2 \text{ cm} = 0.02 \text{ m}, \qquad I = 1 \text{ A}, \qquad \bar{B} = 1 \times 10^{-5} \text{ T}$$

$$\vec{B} = 1 \times 10^{-5} \text{ T}$$

We know: Magnetic field due to a long straight wire carrying current =  $\frac{\mu_0 I}{2\pi r}$   $\vec{P}$  at  $\vec{P} = \frac{4\pi \times 10^{-7} \times 1}{1} = 1 \times 10^{-5} \, \text{T}$  upward

$$\vec{B}$$
 at P =  $\frac{4\pi \times 10^{-7} \times 1}{2\pi \times 0.02}$  = 1 × 10<sup>-5</sup> T upward

net B = 
$$2 \times 1 \times 10^{-7}$$
 T =  $20 \mu$ T

B at Q = 
$$1 \times 10^{-5}$$
 T downwards

Hence net  $\vec{B} = 0$ 

(b)The minimum B 
$$-\frac{\mu_0 I}{2\pi r}$$

If 
$$r = \frac{\mu_0 I}{2\pi B}$$
 B net = 0

$$r < \frac{\mu_0 I}{2\pi B}$$
 B net = 0

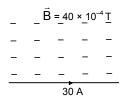

$$r > \frac{\mu_0 I}{2\pi B} B \text{ net} = B - \frac{\mu_0 I}{2\pi B}$$

net field = 
$$\sqrt{(3 \times 10^{-4})^2 + (4 \times 10^{-4})^2}$$
 = 5 × 10<sup>-4</sup> T

A<sub>1</sub>

8. 
$$i = 10 \text{ A. } (\hat{K})$$

B = 
$$2 \times 10^{-3}$$
 T South to North ( $\hat{J}$ )

To cancel the magnetic field the point should be choosen so that the net magnetic field is along - Ĵ

.. The point is along - î direction or along west of the wire.

$$B = \frac{\mu_0 I}{2\pi r}$$

$$\Rightarrow 2 \times 10^{-3} = \frac{4\pi \times 10^{-7} \times 10}{2\pi \times r}$$

$$\Rightarrow$$
 r =  $\frac{2 \times 10^{-7}}{2 \times 10^{-3}}$  = 10<sup>-3</sup> m = 1 mm.

9. Let the tow wires be positioned at O & P

R = OA, = 
$$\sqrt{(0.02)^2 + (0.02)^2}$$
 =  $\sqrt{8 \times 10^{-4}}$  = 2.828 × 10<sup>-2</sup> m

(a) 
$$\vec{B}$$
 due to Q, at A<sub>1</sub> =  $\frac{4\pi \times 10^{-7} \times 10}{2\pi \times 0.02}$  = 1 × 10<sup>-4</sup> T ( $\perp$ r towards up the line)

$$\vec{B}$$
 due to P, at A<sub>1</sub> =  $\frac{4\pi \times 10^{-7} \times 10}{2\pi \times 0.06}$  = 0.33 × 10<sup>-4</sup> T ( $\perp$ r towards down the line)

net 
$$\vec{B} = 1 \times 10^{-4} - 0.33 \times 10^{-4} = 0.67 \times 10^{-4} \text{ T}$$

net 
$$\vec{B}$$
 at  $A_2 = 2 \times 10^{-4} + 0.67 \times 10^{-4} = 2.67 \times 10^{-4}$  T

(c) 
$$\vec{B}$$
 at  $A_3$  due to  $O = 1 \times 10^{-4} \text{ T}$ 

$$\vec{B}$$
 at A<sub>3</sub> due to P = 1 × 10<sup>-4</sup> T

⊥r towards down the line

Net 
$$\vec{B}$$
 at  $A_3 = 2 \times 10^{-4} \text{ T}$ 

(d) 
$$\vec{B}$$
 at A<sub>4</sub> due to O =  $\frac{2 \times 10^{-7} \times 10}{2.828 \times 10^{-2}} = 0.7 \times 10^{-4} \text{ T}$  towards SE

$$\vec{B}$$
 at A<sub>4</sub> due to P = 0.7 × 10<sup>-4</sup> T

Net 
$$\vec{B} = \sqrt{(0.7 \times 10^{-4})^2 + (0.7 \times 10^{-4})^2} = 0.989 \times 10^{-4} \approx 1 \times 10^{-4} \text{ T}$$

10. 
$$\cos \theta = \frac{1}{2}$$
,

$$\theta = 60^{\circ} \& \angle AOB = 60^{\circ}$$

$$B = \frac{\mu_0 I}{2\pi r} = \frac{10^{-7} \times 2 \times 10}{2 \times 10^{-2}} = 10^{-4} T$$

So net is 
$$[(10^{-4})^2 + (10^{-4})^2 + 2(10^{-8}) \text{ Cos } 60^\circ]^{1/2}$$

= 
$$10^{-4}[1 + 1 + 2 \times \frac{1}{2}]^{1/2} = 10^{-4} \times \sqrt{3}$$
 T =  $1.732 \times 10^{-4}$  T

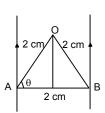

Both are oppositely directed hence net  $\vec{B} = 0$ 

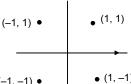

Net 
$$\vec{B} = \frac{2 \times 10^{-7} \times 2 \times 5}{1} = 2 \times 10^{-6} \text{ T} = 2 \mu\text{T}$$

(d) 
$$\vec{B}$$
 due to X =  $\vec{B}$  due to Y = 1 × 10<sup>-6</sup> T both directed along (–) ve Z–axis Hence Net  $\vec{B}$  = 2 × 1.0 × 10<sup>-6</sup> = 2  $\mu$ T

12. (a) For each of the wire

Magnitude of magnetic field

$$= \frac{\mu_0 i}{4\pi r} (Sin45^\circ + Sin45^\circ) = \frac{\mu_0 \times 5}{4\pi \times (5/2)} \frac{2}{\sqrt{2}}$$

For AB  $\odot$  for BC  $\odot$  For CD  $\otimes$  and for DA  $\otimes$ .

The two  $\odot$  and  $2\otimes$  fields cancel each other. Thus  $B_{net} = 0$

$$B_{\text{net}} = [4 + 4 + (4/3) + (4/3)] \times 10^{-5} = \frac{32}{3} \times 10^{-5} = 10.6 \times 10^{-5} \approx 1.1 \times 10^{-4} \text{ T}$$

due to (3)

$$B_{net} = 0$$

13. Since all the points lie along a circle with radius = 'd' Hence 'R' & 'Q' both at a distance 'd' from the wire.

So, magnetic field  $\vec{B}$  due to are same in magnitude.

As the wires can be treated as semi infinite straight current carrying

conductors. Hence magnetic field  $\vec{B} = \frac{\pi_0 i}{4\pi d}$ 

B<sub>1</sub> due to 1 is 0

$$B_2$$
 due to 2 is  $\frac{\pi_0 i}{4\pi d}$ 

At Q

$$B_1$$
 due to 1 is  $\frac{\pi_0 i}{4\pi d}$ 

B<sub>2</sub> due to 2 is 0

At R

B<sub>1</sub> due to 1 is 0

$$B_2$$
 due to 2 is  $\frac{\pi_0 i}{4\pi d}$ 

At S

$$B_1$$
 due to 1 is  $\frac{\pi_0 i}{4\pi d}$ 

B<sub>2</sub> due to 2 is 0

14. B = 
$$\frac{\pi_0 i}{4\pi d}$$
 2 Sin  $\theta$ 

$$= \frac{\pi_0 i}{4\pi d} \frac{2 \times x}{2 \times \sqrt{d^2 + \frac{x^2}{4}}} = \frac{\mu_0 i x}{4\pi d \sqrt{d^2 + \frac{x^2}{4}}}$$

Neglecting x w.r.t.

$$\mathsf{B} = \frac{\mu_0 \mathsf{i} \mathsf{x}}{\mu \pi \mathsf{d} \sqrt{\mathsf{d}^2}} = \frac{\mu_0 \mathsf{i} \mathsf{x}}{\mu \pi \mathsf{d}^2}$$

$$\therefore B \propto \frac{1}{d^2}$$

(b) When  $x \gg d$ , neglecting d w.r.t. x

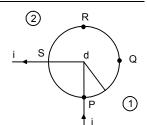

$$B = \frac{\mu_0 i x}{4\pi d x / 2} = \frac{2\mu_0 i}{4\pi d}$$

∴ B 
$$\propto \frac{1}{d}$$

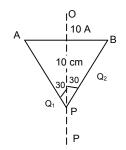

$$r = OP = \frac{\sqrt{3}}{2} \times 0.1 \text{ m}$$

$$\mathsf{B} = \frac{\mu_0 I}{4\pi r} (\mathsf{Sin} \phi_1 + \mathsf{Sin} \phi_2)$$

$$= \frac{10^{-7} \times 10 \times 1}{\frac{\sqrt{3}}{2} \times 0.1} = \frac{2 \times 10^{-5}}{1.732} = 1.154 \times 10^{-5} \text{ T} = 11.54 \text{ }\mu\text{T}$$

16. 
$$B_1 = \frac{\mu_0 i}{2\pi d}$$
,

16. 
$$B_1 = \frac{\mu_0 i}{2\pi d}$$
,  $B_2 = \frac{\mu_0 i}{4\pi d} (2 \times \text{Sin}\theta) = \frac{\mu_0 i}{4\pi d} \frac{2 \times \ell}{2\sqrt{d^2 + \frac{\ell^2}{4}}} = \frac{\mu_0 i \ell}{4\pi d\sqrt{d^2 + \frac{\ell^2}{4}}}$ 

$$\theta$$

$$B_1 - B_2 = \frac{1}{100} B_2 \Rightarrow \frac{\mu_0 i}{2\pi d} - \frac{\mu_0 i \ell}{4\pi d \sqrt{d^2 + \frac{\ell^2}{4}}} = \frac{\mu_0 i}{200\pi d}$$

$$\Rightarrow \frac{\mu_0 i \ell}{4\pi d \sqrt{d^2 + \frac{\ell^2}{4}}} = \frac{\mu_0 i}{\pi d} \left( \frac{1}{2} - \frac{1}{200} \right)$$

$$\Rightarrow \frac{\ell}{4\sqrt{d^2 + \frac{\ell^2}{4}}} = \frac{99}{200} \qquad \Rightarrow \frac{\ell^2}{d^2 + \frac{\ell^2}{4}} = \left(\frac{99 \times 4}{200}\right)^2 = \frac{156816}{40000} = 3.92$$

$$\Rightarrow \ell^2 = 3.92 d^2 + \frac{3.92}{4} \ell^2$$

$$\left(\frac{1-3.92}{4}\right)\!\ell^2 = 3.92 \ d^2 \ \Rightarrow 0.02 \ \ell^2 = 3.92 \ d^2 \ \Rightarrow \frac{d^2}{\ell^2} = \frac{0.02}{3.92} = \frac{d}{\ell} = \sqrt{\frac{0.02}{3.92}} = 0.07$$

17. As resistances vary as r & 2r

Hence Current along ABC =  $\frac{i}{3}$  & along ADC =  $\frac{2}{3}$ 

$$\vec{B} \text{ due to ADC} = 2 \left\lceil \frac{\mu_0 \vec{i} \times 2 \times 2 \times \sqrt{2}}{4\pi 3a} \right\rceil = \frac{2\sqrt{2}\mu_0 \vec{i}}{3\pi a}$$

$$\vec{B}$$
 due to ABC =  $2\left[\frac{\mu_0 i \times 2 \times \sqrt{2}}{4\pi 3a}\right] = \frac{2\sqrt{2}\mu_0 i}{6\pi a}$ 

Now 
$$\vec{B} = \frac{2\sqrt{2}\mu_0 i}{3\pi a} - \frac{2\sqrt{2}\mu_0 i}{6\pi a} = \frac{\sqrt{2}\mu_0 i}{3\pi a}$$

$$D_0 = \sqrt{\left(\frac{3a}{4}\right)^2 + \left(\frac{a}{2}\right)^2} = \sqrt{\frac{9a^2}{16} + \frac{a^2}{4}} = \sqrt{\frac{13a^2}{16}} = \frac{a\sqrt{13}}{4}$$

$$B_{AB} = \frac{\mu_0}{4\pi} \times \frac{i}{2(a/4)} (Sin (90 - i) + Sin (90 - \alpha))$$

$$= \frac{\mu_0 \times 2i}{4\pi a} 2 \cos \alpha = \frac{\mu_0 \times 2i}{4\pi a} \times 2 \times \frac{\left(a/2\right)}{a\left(\sqrt{5}/4\right)} = \frac{2\mu_0 i}{\pi\sqrt{5}}$$

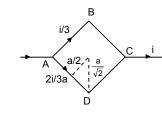

Magnetic field due to DC

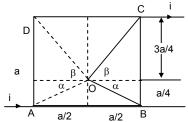

$$B_{DC} = \frac{\mu_0}{4\pi} \times \frac{i}{2(3a/4)} 2Sin (90^{\circ} - B)$$

$$= \frac{\mu_0 i \times 4 \times 2}{4\pi \times 3a} \cos \beta = \frac{\mu_0 i}{\pi \times 3a} \times \frac{(a/2)}{(\sqrt{13a}/4)} = \frac{2\mu_0 i}{\pi a 3\sqrt{13}}$$

Hence, net magnetic field is 
$$\frac{2\mu_0 i}{\pi\sqrt{5}} - \frac{2\mu_0 i}{\pi a 3\sqrt{13}} = \frac{2\mu_0 i}{\pi a} \left[ \frac{1}{\sqrt{5}} - \frac{1}{3\sqrt{13}} \right]$$

- 19. B due t BC &
  - B due to AD at Pt 'P' are equal ore Opposite

Hence net  $\vec{B} = 0$ 

Similarly, due to AB & CD at P = 0

 $\therefore$  The net  $\vec{B}$  at the Centre of the square loop = zero.

For AC B 
$$\otimes$$
 B =  $\frac{\mu_0 i}{4\pi r}$  (Sin60° + Sin60°)

For BD B 
$$\odot$$
 B =  $\frac{\mu_0 i}{4\pi r}$  (Sin60°)

For DC B 
$$\otimes$$
 B =  $\frac{\mu_0 i}{4\pi r}$  (Sin60°)

∴ Net B = 0

$$AB = BC = CA = \ell/3$$

Current = i

$$AO = \frac{\sqrt{3}}{2}a = \frac{\sqrt{3} \times \ell}{2 \times 3} = \frac{\ell}{2\sqrt{3}}$$

$$\phi_1 = \phi_2 = 60^{\circ}$$

So, MO = 
$$\frac{\ell}{6\sqrt{3}}$$
 as AM : MO = 2 : 1

 $\vec{B}$  due to BC at <.

$$= \frac{\mu_0 i}{4\pi r} (Sin\phi_1 + Sin\phi_2) = \frac{\mu_0 i}{4\pi} \times i \times 6\sqrt{3} \times \sqrt{3} = \frac{\mu_0 i \times 9}{2\pi \ell}$$

net 
$$\vec{B} = \frac{9\mu_0 i}{2\pi\ell} \times 3 = \frac{27\mu_0 i}{2\pi\ell}$$

(b) 
$$\vec{B}$$
 due to AD =  $\frac{\mu_0 i \times 8}{4\pi \times \ell} \sqrt{2} = \frac{8\sqrt{2}\mu_0 i}{4\pi \ell}$ 

Net 
$$\vec{B} = \frac{8\sqrt{2}\mu_0 i}{4\pi\ell} \times 4 = \frac{8\sqrt{2}\mu_0 i}{\pi\ell}$$

$$\Rightarrow$$
 r = x Sin ( $\alpha$ /2)

Magnetic field B due to AR

$$\frac{\mu_0 i}{4\pi r} [Sin(180 - (90 - (\alpha/2))) + 1]$$

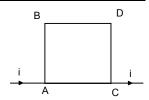

$$\Rightarrow \frac{\mu_0 i [Sin(90 - (\alpha/2)) + 1]}{4\pi \times Sin(\alpha/2)}$$

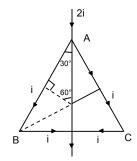

$$= \frac{\mu_0 i(Cos(\alpha/2) + 1)}{4\pi \times Sin(\alpha/2)}$$

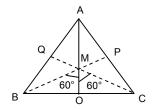

$$=\frac{\mu_0 \text{i} 2 \text{Cos}^4(\alpha/4)}{4\pi \times 2 \text{Sin}(\alpha/4) \text{Cos}(\alpha/4)} = \frac{\mu_0 \text{i}}{4\pi x} \text{Cot}(\alpha/4)$$

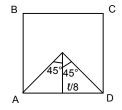

The magnetic field due to both the wire.

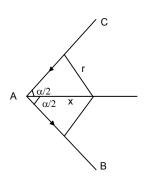

$$\frac{2\mu_0 i}{4\pi x} Cot(\alpha \, / \, 4) \, = \, \frac{\mu_0 i}{2\pi x} Cot(\alpha \, / \, 4)$$

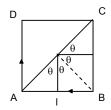

$$\frac{\mu_0 i \times 2}{4\pi b} \times 2 \sin\theta = \frac{\mu_0 i \sin\theta}{\pi b}$$
$$= \frac{\mu_0 i \ell}{\pi b (\ell^2 + b^2)} = \vec{B}DC$$

$$= \frac{\mu_0 i \ell}{\pi b \sqrt{\ell^2 + b^2}} = \vec{B}DC \qquad \qquad \therefore \sin(\ell^2 + b) = \frac{(\ell/2)}{\sqrt{\ell^2/4 + b^2/4}} = \frac{\ell}{\sqrt{\ell^2 + b^2}}$$

**BBC** 

$$\frac{\mu_0 i \times 2}{4\pi\ell} \times 2 \times 2 \text{Sin}\theta' = \frac{\mu_0 i \text{Sin}\theta'}{\pi\ell} \quad \therefore \text{Sin }\theta' = \frac{(b/2)}{\sqrt{\ell^2/4 + b^2/4}} = \frac{b}{\sqrt{\ell^2 + b^2}}$$

$$= \frac{\mu_0 ib}{\pi \ell \sqrt{\ell^2 + b^2}} = \vec{B}AD$$

$$\text{Net } \vec{B} = \frac{2\mu_0 i\ell}{\pi b \sqrt{\ell^2 + b^2}} + \frac{2\mu_0 ib}{\pi \ell \sqrt{\ell^2 + b^2}} = \frac{2\mu_0 i(\ell^2 + b^2)}{\pi \ell b \sqrt{\ell^2 + b^2}} = \frac{2\mu_0 i \sqrt{\ell^2 + b^2}}{\pi \ell b}$$

24. 
$$2\theta = \frac{2\pi}{n} \Rightarrow \theta = \frac{\pi}{n}$$
,

$$\ell = \frac{2\pi r}{r}$$

Tan 
$$\theta = \frac{\ell}{2x} \Rightarrow x = \frac{\ell}{2Tan\theta}$$

$$\frac{\ell}{2} = \frac{\pi r}{n}$$

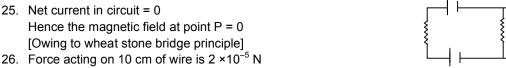

$$\mathsf{B}_{\mathsf{AB}} = \frac{\mu_0 \mathsf{i}}{4\pi(\mathsf{x})} (\mathsf{Sin}\theta + \mathsf{Sin}\theta) = \frac{\mu_0 \mathsf{i} \mathsf{2} \mathsf{Tan}\theta \times \mathsf{2} \mathsf{Sin}\theta}{4\pi\ell}$$

$$= \frac{\mu_0 \text{i2Tan}(\pi/n) 2 \text{Sin}(\pi/n) n}{4\pi 2\pi r} = \frac{\mu_0 \text{inTan}(\pi/n) \text{Sin}(\pi/n)}{2\pi^2 r}$$

For n sides, B<sub>net</sub> = 
$$\frac{\mu_0 \text{inTan}(\pi/n)\text{Sin}(\pi/n)}{2\pi^2 \text{r}}$$

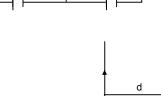

Hence the magnetic field at point P = 0[Owing to wheat stone bridge principle]

$$\begin{split} \frac{dF}{dI} &= \frac{\mu_0 i_1 i_2}{2\pi d} \\ &\Rightarrow \frac{2 \times 10^{-5}}{10 \times 10^{-2}} = \frac{\mu_0 \times 20 \times 20}{2\pi d} \end{split}$$

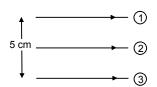

$$\Rightarrow d = \frac{4\pi \times 10^{-7} \times 20 \times 20 \times 10 \times 10^{-2}}{2\pi \times 2 \times 10^{-5}} = 400 \times 10^{-3} = 0.4 \text{ m} = 40 \text{ cm}$$

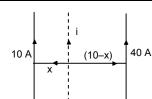

Magnetic force due to two parallel Current Carrying wires.

$$F = \frac{\mu_0 I_1 I_2}{2\pi r}$$

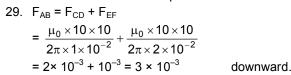

So, 
$$\vec{F}$$
 or  $1 = \vec{F}$  by  $2 + \vec{F}$  by  $3 = \frac{\mu_0 \times 10 \times 10}{2\pi \times 5 \times 10^{-2}} + \frac{\mu_0 \times 10 \times 10}{2\pi \times 10 \times 10^{-2}} = \frac{4\pi \times 10^{-7} \times 10 \times 10}{2\pi \times 5 \times 10^{-2}} + \frac{4\pi \times 10^{-7} \times 10 \times 10}{2\pi \times 10 \times 10^{-2}} = \frac{2 \times 10^{-3}}{5} + \frac{10^{-3}}{5} = \frac{3 \times 10^{-3}}{5} = 6 \times 10^{-4} \,\text{N} \text{ towards middle wire}$ 

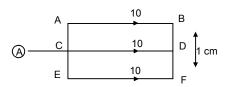

28. 
$$\frac{\mu_0 10i}{2\pi x} = \frac{\mu_0 i40}{2\pi (10 - x)}$$
$$\Rightarrow \frac{10}{x} = \frac{40}{10 - x} \Rightarrow \frac{1}{x} = \frac{4}{10 - x}$$
$$\Rightarrow 10 - x = 4x \Rightarrow 5x = 10 \Rightarrow x = 2 \text{ cm}$$

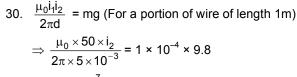

The third wire should be placed 2 cm from the 10 A wire and 8 cm from 40 A wire.

 $F_{CD} = F_{AB} + F_{EF}$ As  $F_{AB} \& F_{EF}$  are equal and oppositely directed hence F = 0

$$\Rightarrow \frac{4\pi \times 10^{-7} \times 5 \times i_2}{2\pi \times 5 \times 10^{-3}} = 9.8 \times 10^{-4}$$

$$\Rightarrow 2 \times i_2 \times 10^{-3} = 9.3 \times 10^{-3} \times 10^{-1}$$

$$\Rightarrow i_2 = \frac{9.8}{2} \times 10^{-1} = 0.49 \text{ A}$$

31.  $I_2 = 6 \text{ A}$  $I_1 = 10 \text{ A}$

Let the straight current carrying wire be kept at a distance R from centre. Given I = 4i

$$\vec{B}$$
 due to wire =  $\frac{\mu_0 I}{2\pi R} = \frac{\mu_0 \times 4i}{2\pi R}$ 

Now, the B due to both will balance each other

Hence 
$$\frac{\mu_0 i}{2r} = \frac{\mu_0 4 i}{2\pi R} \Rightarrow R = \frac{4r}{\pi}$$

Hence the straight wire should be kept at a distance  $4\pi/r$  from centre in such a way that the direction of current in it is opposite to that in the nearest part of circular wire. As a result the direction will  $\vec{B}$  will be oppose.

(b) Taking a cylindrical surface just out side the tube, from ampere's law.

51. We know,  $\int B \times dI = \mu_0 i$ . Theoritically B = 0 a t A

If, a current is passed through the loop PQRS, then

$$\label{eq:B} B = \frac{\mu_0 i}{2(\ell+b)} \mbox{will exist in its vicinity}.$$

However practically this is not true. As a current carrying loop, irrespective of its near about position is always affected by an existing magnetic field.

- 52. (a) At point P, i = 0, Thus B = 0
  - (b) At point R, i = 0, B = 0
  - (c) At point  $\theta$ ,

$$\Rightarrow$$
 B ×2I =  $\mu_0$ kI  $\Rightarrow$  B =  $\frac{\mu_0 k}{2}$ 

Since the B due to the 2 stripes are along the same direction, thus,
